National Register of Historic Places
Registration Form

1. Name of Property

Historic name: N/A
Other name/site number: Eight Mile Creek Warren Truss Bridge (preferred); 30-LT-12

2. Location

On Osborne Terrace, 0.2 miles west of the "Y" intersection with Eisenhower Terrace; 1.0 mile
west of Main Street, Ottawa City.

   city or town Ottawa
   state code KS
   county Franklin
   county code 059
   zip code 66067

3. State/Federal Agency Certification

As the designated authority under the National Historic Preservation Act of 1986, as amended, I hereby
certify that this XX nomination request for determination of eligibility meets the documentation
standards for registering properties in the National Register of Historic Places and meets the procedural
and professional requirements set forth in 36 CFR Part 60. In my opinion, the property XX meets
does not meet the National Register criteria. I recommend that this property be considered significant
nationally XX statewide ___ locally. (___ See continuation sheet for additional comments.)

Richard D. Farnsworth

Walls
Roof
Other: Metal; Steel

Narrative Description: (Describe the historic and current condition of the property on one or more continuation sheets.)
8. Statement of Significance

Applicable National Register Criteria (Mark "X" in one or more boxes for the criteria qualifying the property for National Register listing.)

___ A Property is associated with events that have made a significant contribution to the broad patterns of our history.
___ B Property is associated with the lives of persons significant in our past.
___ C Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
___ D Property has yielded, or is likely to yield, information important in prehistory or history.

Criteria Considerations (Mark "X" in all the boxes that apply.)

___ A owned by a religious institution or used for religious purposes.
___ B removed from its original location.
___ C a birthplace or a grave.
___ D a cemetery.
___ E a reconstructed building, object, or structure.
___ F a commemorative property.
___ G less than 50 years of age or achieved significance within the past 50 years.

Verbal Boundary Description (Describe the boundaries of the property on a continuation sheet.)

Boundary Justification (Explain why the boundaries were selected on a continuation sheet.)

11. Form Prepared By

name/title: Kerry Davis, Architectural Historian & Elizabeth Rosin, Partner

organization: Historic Preservation Services

date: August 5, 2002

street & number: 323 West Eighth Street, Suite 112

telephone: (816) 221-5133

city or town: Kansas City

state: Missouri zip code: 64105

Additional Documentation

Submit the following items with the completed form:

Continuation Sheets

Maps

A USGS map (7.5 or 15 minute series) indicating the property's location.

A sketch map for historic districts and properties having large acreage or numerous resources.

Photographs

Representative black-and-white photographs of the property.

Additional items (Check with the SHPO or FPO for any additional items.)

Property Owners

(Complete this item at the request of the SHPO or FPO.)

telephone: 785-229-3550

city or town: Ottawa

state: KS zip code: 66067
DESCRIPTION
LOCATION AND SETTING
The Eight Mile Creek Warren Truss Bridge is located 1.0 mile west of Main Street, Ottawa City, in the Osage Hills region of eastern Kansas; NW ½ of Section 26, Township 16S, Range 19E. The region is defined by broad plains hills interrupted by tree-lined creek valleys. The Eight Mile Creek Warren Truss Bridge carries Osborne Terrace across Eight Mile Creek, a wide, deep branch of the Marais des Cygnes River. The gravel roadway, flanked by sparse woods and low lands, aligns directly with the Eight Mile Creek Warren Truss Bridge. The Atchison, Topeka & Santa Fe railroad bed and bridge abutments are intact approximately 25 yards to the south, running parallel to the Eight Mile Creek Warren Truss Bridge.

TRUSS TYPE
The Eight Mile Creek Warren Truss Bridge consists of a riveted pony truss that measures 92 feet in length and three, 32½-foot, flat, concrete girder approach spans, two of which approach from the west and one of which approaches from the east. The deck is 20 feet wide. Poured concrete abutments support the outer ends of the outermost approach spans. Three concrete piers support the ends of the inner approach spans and the truss bearings. The abutment side walls extend approximately 12 feet along the approach grades.

Seven slopes form the polygonal top chord, creating an arched shape. The top chords and inclined end posts consist of two channels, a cover plate, lacing bars, and stay plates; the bottom chords consist of two channels with stay plates.

The web members include vertical posts that form six equivalent panels and diagonal members that form the system of alternating equilateral triangles distinctive to the Warren truss. The vertical posts are composed of angle and plate stock; the diagonal members are alternately composed of angle stock with stay plates and riveted plate and angle stock.

The concrete deck is 20 feet wide with curbs and downspouts. It rises 17½ feet above the creek bed on steel I-beam stringers. Floor beams located at the base of each vertical post are structurally integrated among the stringers.

The historic, paired, parallel angle bar guardrails are intact along the length of the truss. The original cast concrete balustrade is intact along the full length of each approach span. Letters in relief read “INLAND” and “SCULLIN” on several structural steel components.

INTEGRITY
The Eight Mile Creek Warren Truss Bridge is an excellent example of this truss bridge type, historically very popular in Kansas. With no apparent alterations made to the original design or materials, the Eight Mile Creek

---

1 A pony truss is also referred to as a low truss.
2 A Warren truss with a polygonal top chord is also referred to as a modified Warren truss.
Warren Truss Bridge retains a high degree of integrity. The original workmanship, materials, design, setting, and feeling of the property are readily apparent. Furthermore, the potential for preservation of the bridge is high. Located on a lightly traveled road, it is unlikely that traffic requirements will necessitate alteration or replacement.

1 Dale Nimz, Activity III Review Initial Assessment Metal Truss Bridges. (Topeka: Kansas State Historical Society, 1998), 6. Nimz stated there were approximately 400 extant Warren trusses in Kansas.

STATEMENT OF SIGNIFICANCE
The Eight Mile Creek Warren Truss Bridge is significant under National Register Criterion C in the areas of Engineering and Transportation. As defined by the Multiple Property Documentation Form for Metal Truss Bridges in Kansas, it is an excellent example of the Warren truss bridge type. Built c.1920, the Eight Mile Creek Warren Truss Bridge represents a common bridge solution for a long span. Its riveted structure and concrete deck, abutments, and piers illustrate the standardization of these construction techniques and materials during the period of significance. As no historic name identifies this bridge, the preferred name “Eight Mile Creek Warren Truss Bridge” has been assigned. This describes the location, design, and function of the structure.

ELABORATION
The need for all-weather crossings of rivers and streams corresponded to the growth of the market economy across Kansas during the late nineteenth and early twentieth centuries. Bridges provided farmers easy access to markets and could make the difference between growth and stagnation for the many small, young communities across the state.¹ Proximity to a bridge often secured a town’s economic stability, and it contributed to a local sense of modernity.

Prior to the 1930s, the railroad was the primary means of long-distance travel and there was little need for roads to extend more than a few dozen miles. With little stimulus for improving roads that would cross multiple jurisdictions, road construction and maintenance remained local concerns. County commissioners often carried the burden of selecting bridge locations, over which much contention was common.

The range of choices for bridge designs and companies was vast. Many of the larger bridge companies sold metal truss bridges through mail order catalogues. County commissioners could simply specify the span, clearance needs, and truss type (if there was a preference), then choose the lowest bidder from the numerous competing companies that had salesmen in the field.

By the late nineteenth century, fabrication of iron and steel was widespread. The speed of construction and the relatively low cost of metal truss bridge parts ensured their popularity over labor-intensive masonry bridges and short-lived timber bridges. Toward the end of the nineteenth century, the quality, quantity, and cost of steel improved to such a degree that it virtually replaced wrought iron for bridge construction by 1910.²

Most metal trusses were constructed of built-up members composed of mass-produced, standard-shaped channel, plate, and angle stock purchased from one or more of the numerous steel companies nationwide. The bridge companies preassembled trusses in their factories then simply shipped them to the bridge site for installation. Installation involved grading approaches, constructing abutments and piers, erecting preassembled floor and truss members, and placing deck material.

¹ Larry Jochims, Metal Truss Bridges in Kansas 1861-1939, National Register of Historic Places Multiple Property Documentation Form, (Topeka: Kansas State Historical Society, 1989), E.
² Ibid, F.
Before 1900, generally all panel point connections – the locations at which structural bridge elements intersect – were made with the use of a pin. This technique was so widespread that it became one of the distinctive features of American bridge construction in the nineteenth century.\(^3\) However, subsequent advancements in pneumatic riveting techniques greatly improved rivet installation quality, enabling more reliable panel point connections. With the increased portability of this construction technology, the more rigid riveting technique rapidly surpassed pin-connected bridge construction during the first years of the twentieth century. The riveted construction of the Eight Mile Creek Warren Truss Bridge illustrates the standardization of this technique.

In addition, the contemporary development of economic cement production promoted the widespread combination of steel and concrete in bridge construction. It was not uncommon for older metal truss bridges to receive new reinforced concrete decks or poured concrete reinforcements for older stone abutments. By the 1920s, reinforced concrete was the standard material for abutments, piers, and decks of steel truss bridges. The concrete deck, abutments, and piers of the Eight Mile Creek Warren Truss Bridge are typical of bridges built during this period.

The Eight Mile Creek Warren Truss Bridge is a classic example of the Warren truss design. Patented in 1848, the Warren truss has diagonal members alternately placed in either tension or compression, resulting in a visually distinctive system of alternating equilateral triangles. Vertical members are often incorporated to further strengthen the truss and many, such as the Eight Mile Creek Warren Truss Bridge, also include a polygonal top chord for additional structural stability.\(^4\)

While the straightforward design of the Warren truss was desirable, the lack of counters and sometimes verticals subjected the center pins to extensive wear, making it less durable and therefore less popular than the Pratt truss during the nineteenth century. The later standardization of riveted techniques eliminated these issues and the Warren truss gained popularity as a bridge type.\(^5\) In Kansas, Warren trusses were constructed well into the middle of the twentieth century, suggesting the appeal of the design’s strength, simplicity, and economical construction costs. In 1998, approximately 400 Warren truss bridges, including the Eight Mile Creek Warren Truss Bridge, existed throughout the state of Kansas.\(^6\)

**STRUCTURE HISTORY**

Platted in 1864 along a natural ford across the banks of the Marais Des Cygnes River, the nearby city of Ottawa grew rapidly from its inception. Within its first year of existence, Ottawa was designated the seat of Franklin County, a toll bridge was built above the ford, a sawmill, a general merchandise store, and a hostelry were established, and the first locomotive arrived on the Leavenworth, Lawrence & Galveston Railroad. The city became the hub of Franklin County with “spokes” of railroad lines leading in all directions. By the early 1880s, five of the six railroad lines that traversed Franklin County passed through Ottawa, including two branches of the

\(^5\) Jochims, E2.

\(^6\) Nimz, 6.
Kansas City, Lawrence & Southern Kansas Railroad, the Ottawa & Burlington Railroad, the Leroy Branch of the Missouri Pacific Railroad, and the Kansas City & Emporia Railroad. As the commercial and cultural center of the county at the time, Ottawa supported several newspapers, eleven lawyers, eleven doctors, four dentists, a number of real estate agents, insurance men, and street brokers, two banks, three grist mills, an oil mill, a foundry and machine shops, two furniture companies, and a saw mill. In 1903, the Warner Manufacturing Company moved its plants from Waverly and Melvern, establishing a large factory in Ottawa. Within two months, the plant was turning out 22 miles of woven wire fencing per day in addition to small engines and power equipment. Within the first decade of the twentieth century, natural gas was discovered near the city, spurring further commercial and industrial development. By the late 1930s, Ottawa boasted two railroad stations, service to three bus lines, two hotels, three tourist camps, three motion picture houses, several hatcheries, two mail order printing houses, a stone-crushing plant, a foundry and woodwork factory, and the car shops and division headquarters of the Santa Fe Railway. Ottawa was typical of cities throughout Kansas that served not only as trading and shipping points for the surrounding agricultural community, but as cultural and governmental centers for the county. As a result, fords and bridges that provided access to and from the city’s municipal buildings and commercial markets were critical to the survival of the regional economy.

According to the Franklin County Road and Bridge records, the Eight Mile Creek Warren Truss Bridge was constructed c.1920. No further construction history has presently been located. While the builder is unknown, markings on the structural members indicate that Inland Steel Company of Chicago, Illinois and Scullin Steel Company of St. Louis, Missouri produced the stock metal.

---

8 Inquiry into the Franklin County Road and Bridge records, Kansas Department of Transportation records, Kansas State Historical Society archives, and Western Contractor revealed no further construction history specific to the Eight Mile Creek Warren Truss Bridge.

GEOGRAPHICAL DATA

Verbal Boundary Description:
Located on the W ½ of Section 26, Township 16S, Range 19E, the Eight Mile Creek Warren Truss Bridge encompasses an area measuring approximately 189 feet by 20 feet. The northwest corner of this area corresponds to the northwest corner of the bridge.

Boundary Justification:
The boundary includes the truss, deck, abutments, and associated approaches that represent the significant features associated with the bridge structure.
