National Register of Historic Places
Registration Form

This form is for use in nominating or requesting determinations of eligibility for individual properties or districts. See Instructions in Guidelines for Completing National Register Forms (National Register Bulletin 16). Complete each item by marking “x” in the appropriate box or by entering the requested information. If an item does not apply to the property being documented, enter “N/A” for “not applicable.” For functions, styles, materials, and areas of significance, enter only the categories and subcategories listed in the instructions. For additional space use continuation sheets (Form 10-900a). Type all entries.

1. Name of Property

historic name: Carey’s Ford Bridge
other names/site number: Carey’s Ford Bridge

2. Location

4 miles west, 1.5 miles north, 3 miles west of intersection F.A.S. 250 and F.A.S. 656.

street & number: Unmarked county road

city, town: Osawatomie

state: Kansas code: KS county: Miami code: 121 vicinity: x

3. Classification

Ownership of Property

4. State/Federal Agency Certification

As the designated authority under the National Historic Preservation Act of 1966, as amended, I hereby certify that this nomination request for determination of eligibility meets the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60.

In my opinion, the property ☑ meets ☐ does not meet the National Register criteria. ☐ See continuation sheet.

[Signature of certifying official]
[Date]

State or Federal agency and bureau

In my opinion, the property ☐ meets ☑ does not meet the National Register criteria. ☐ See continuation sheet.

[Signature of commenting or other official]
[Date]

State or Federal agency and bureau

5. National Park Service Certification

I, hereby, certify that this property is:

☐ entered in the National Register.
[See continuation sheet.]

☐ determined eligible for the National Register. [See continuation sheet.]

☐ determined not eligible for the National Register.

☐ removed from the National Register.

☐ other, (explain:)

[Signature of the Keeper]
[Date of Action]
Carey's Ford bridge, built in 1909, consists of a main camelback span which is 159 feet long and 15.5 feet wide. The two Warren pony spans are 37 feet above the water level.

The members of a truss bridge are designated either as chord members or web members. Chord members are those mainly defining the outlines of the structure and they are termed lower or upper chord members depending on whether they are found at the bottom or the top of the structure. Members between the chords are web members. They are called posts or ties if they sustain compression or tension respectively. In the instance of the Carey's Ford bridge, as with all camelback trusses, the web members are alternately vertical and inclined. The inclined members are in tension and the verticals in compression. In the case of the two pony trusses, the diagonals carry both compressive as well as tensile forces.

In the case of the camelback truss the inclined endpoints and top chord consist of exactly five slopes. In the Carey's Ford bridge they are built up of sections consisting of two steel channels, a top plate and tied together with single bar lacing. The hip verticals, posts and main diagonals are all fabricated from angle stock with horizontal flat lacing bars. The portal bracing is fabricated from angle stock and flat bars. The main connections are pinned. The riveted pony spans are Warren trusses with verticals. It features single bar "ladder" type bracing on diagonals and verticals. It is of all riveted construction.

The hip verticals of the pony truss at the east approach have been reinforced but the bridge retains a high degree of its structural integrity.
The great evolution of truss bridge construction began in the United States soon after the publication of Squire Whipple's historic work on stresses in 1840. Prior to this the design work was essentially that of trial and error, experience and judgement. The Warren and Pratt trusses were rational designs and lent themselves readily to the system of analysis postulated by Whipple. They were, therefore, readily and rapidly accepted and formed the foundation for a greater part of American truss design. The camelback, with its five slope-polygonal top chord is a variant of the Pratt truss. This arched top chord made for a stronger bridge while using the same amount of material. The five slopes allowed for both greater standardization of its members and better stress distribution than other Pratt variants such as the Parker. It was also a more economical design in many situations.

The greater strength of steel over wrought iron allowed the use of fewer, though more massive, members. Steel bridges make a definite first impression on the viewer. As Davie Weitzman reports in his Traces of the Past, the steel bridge appears "more massive, ponderous, more earthbound," than its wrought iron relative. Although the Carey's Ford bridge is fabricated from steel, it still retains the popular 19th century practice of pinning the main connections. In this respect it represents a transitional phase in bridge construction. Pin connections were vestigial in Kansas bridges by 1909.

The camelback truss featured in this nomination is the oldest and one of the three remaining camelback through trusses left in Kansas. It retains a high degree of its integrity. It was also constructed by a prolific out-of-state builder, Kansas City Bridge Company of Kansas City, Missouri.

Bridges were a high priority item for Miami county in 1908. It was becoming increasing apparent that access to centers of trade had to be
improved. Consequently the county commissioner, W. M. Krumrick, proposed the erection of four bridges. The largest of the four was to cross Carey's Ford over the Marais des Cygnes river and is the subject of the nomination. It would greatly improve access to and open up markets in Osawatomie.

Krumrick and Chairman Archie Lee voted in favor of the bridges while Commissioner R. Hampson voted against. Although the measure passed, the controversy had just begun. The need for river crossings was never contested but the exact locations were. The two major sites for the bridge of interest in this nomination were Henry Carey's Ford between sections 36 T17 R21 and S1 T18 R21, and on a site just south of a Mr. Croan's house on the range line.

Newspapers advised against the choice of Carey's Ford even though a majority of the commission favored it. Any bridge, they argued, would benefit the county. Opponents should instead lobby for the erection of additional bridges.

Bids were opened for a structure on the Carey's Ford site on December 7, 1908. Six companies submitted bids, the Illinois Steel Bridge Company ($7,300); the Midland Bridge Company ($7,250); the Missouri Valley Bridge and Iron Company ($7,150); Canton Bridge Company ($7,500); Standard Bridge Company ($7,640); and Kansas City Bridge Company ($7,750 or $6,885).

Opposition again surfaced and the decision was postponed until the morning of December 8. At this time Commissioner Hampson offered a motion to reject building the bridge because of the location dispute and the great expense. The motion was rejected and the contract was given to the Kansas City Bridge Company for $6,885.

When several citizens proposed going to court to stop construction the Western Spirit advised caution. If such tack became common, few bridges would ever be built. A few dissatisfied individuals could halt such construction in every locality. The newspaper again advised that Miami county people should organize to have a dozen more bridges built.

The advice was evidently taken as no further vocal opposition appeared and the project was pursued until completion in 1909.

The Kansas Department of Transportation (KDOT) carried out a statewide inventory of historic bridges between 1980 and 1983. The bridges to be included were identified through computer printouts developed by KDOT, from information supplied by the counties (since almost all of the historic
bridges were located on secondary rather than primary road system), and by
direct observation by field personnel. All bridges were inspected by KDOT
personnel to verify the data on file. That information was jointly
evaluated by representatives of KDOT, Kansas State Historical Society, and
the State Historic Preservation Officer.

Each structure was evaluated using a points rating system adapted from
the points evaluation rating developed by the Ohio Department of
Transportation and Ohio Historic Preservation Office. Consideration was
given to areas such as age, builder, number of spans, length, special
features, history, integrity, surviving numbers, and preservation
potential.

In many instances there is little information about individual
structures. Often bridge plaques which may have contained information have
been removed, or the county's records are not complete or have been
destroyed. Due to the large numbers of similar structures there is often
little to choose from in differentiating among individual bridges other
than condition and the likelihood of preservation.

The purpose of the KDOT study and subsequent evaluation was to
identify a representative selection of bridges of each class. Through this
approach KDOT and KSHS hope to preserve for posterity some examples of each
type.

Verbal Boundary Description
The nominated property is located on the SE 1/4, SE 1/4, SW 1/4, SE 1/4, section 36, township 17S, range 21E, on a tract measuring 252' x 15.5', whose northeast corner is represented by the northeast corner of the bridge. Beginning at the northeast corner the boundary proceeds 252 feet southwest, 15.5 feet northwest, 252 feet northeast, and 15.5 feet southeast to the point of beginning.

See continuation sheet

Boundary Justification
The boundary includes only that area that is historically associated with the nominated property.
